**About DLHS - 3:**

The District Level Household Survey (DLHS) was initiated in 1997 with a view to assess the utilization of services provided by government health care facilities and people's perception about the quality of services. The District Level Household Survey (DLHS -3) is the third in the series of district surveys, preceded by DLHS-1 in 1998-99 and DLHS-2 in 2002-04. As in DLHS-3, the International Institute for Population Sciences (IIPS) was the nodal agency to conduct DLHS-1 and DLHS-2. DLHS-3, like other two earlier rounds, is designed to provide estimates on important indicators on maternal and child health, family planning and other reproductive health services. In addition, DLHS-3 provides information on important interventions of National Rural Health Mission (NRHM). Unlike other two rounds in which only currently married women age 15-44 years were interviewed, DLHS -3 interviewed ever-married women (age 15-49) and never married women (age 15-24).

The sample size among the districts in the country varies according to their performance in terms of Ante-Natal Care (ANC), institutional delivery, immunization, etc. and it was fixed based on information related to such indicators from DLHS-2. For low performing districts, 1500 Households (HHs), for medium performing districts, 1200 HHs and for good performing districts, 1000 HHs were fixed as sample size. In case of Jamui, sample size was 1200 households with 10% additional HHs to take care of non-response/refusal, etc.

The survey used two-stage stratified random sampling in rural and three-stage stratified sampling in urban areas of each district. The information from 2001 Census was used as sampling frame for selecting primary sampling units (PSUs). In rural areas, all the villages in the district were stratified into different strata based on population /HH size, percentage of SC/ST population, female literacy (7+), etc. The required number of villages from each strata was selected with probability proportional to size (PPS). In selected primary sampling units (villages), household listing was done and required numbers of households were selected using systematic random sampling.

For larger villages (more than 300 HHs) segmentation was carried out. In case of 300 to 600 HHs, two segments of equal size were made and one was selected using PPS. For PSUs having more than 600 HHs, segments of 150 HHs were created depending on the size and then two segments were selected using PPS. In case of urban areas, number of wards were selected using PPS at first stage. In a selected ward, one enumeration block from 2001 census was selected again using PPS. Procedure for segmentation, household selection, etc, was same as in the case of rural PSUs.

The uniform bilingual questionnaires, both in English and in local language, were used in DLHS-3 viz., Household, Ever Married Women (age 15-49), Unmarried Women (age 15-24), Village and Health facility questionnaires.

In the household questionnaire, information on all members of the household and the socio-economic characteristics of the household, assets possessed, number of marriages to usual members of the household since January 2004 and deaths in the household since January 2004 etc. was collected. In case of female deaths, attempts were made to assess maternal death. The household questionnaire also collected information on respondent's knowledge (seen/read/ heard) about messages related to various government health programmes being spread through media and other sources.

The ever married women's questionnaire consisted of sections on women's characteristics, maternal care, immunization and child care, contraception and fertility preferences, reproductive health including knowledge about HIV/AIDS.

The unmarried women's questionnaire contained information on her characteristics, family life education and age at marriage, reproductive health-knowledge and awareness about contraception, HIV / AIDS, etc.

The village questionnaire contained information on availability of health, education and other facilities in the village and whether the health facilities are accessible throughout the year.

For the first time, population-linked facility survey has been conducted in DLHS-3. In a district, all Community Health Centres (CHCs) and District Hospital (DH) were covered. Further, all Sub-centres (SC) and Primary Health Centres (PHC) which were expected to serve the population of the selected PSU were also covered. There were separate questionnaires for SC, PHC, CHC and DH. They broadly include questions on infrastructure, human resources, supply of drugs & instruments, and performance.

#### **Note:**

**DLHS-2:** information is based on data collected from currently married women 15-44 years.

**DLHS-3:** information is based on data collected from ever married women 15-49 years.

**DLHS-2:** In total percentage is adjusted for indicators considering over sampling of urban PSUs in DLHS-2. This adjustment is done in those districts where urban percentage is less than 30.

**DLHS-2:** includes tap (inside residence/yard/plot), tap (shared/public), hand pump/borewell, well-covered.

**DLHS-3:** includes pipe into dwelling, piped to yard/plot, public tap/standpipe.

#### **Unmet need for spacing**

Unmet need for spacing includes the proportion of currently married women who are neither in menopause or had hysterectomy nor are currently pregnant and who want more children after two years or later and are currently not using any family planning method. The women who are not sure about whether and when to have next child are also included in unmet need for spacing.

#### **Unmet need for limiting**

Unmet need for limiting includes the proportion of currently married women who are neither in menopause or had hysterectomy nor are currently pregnant and do not want any more children but are currently not using any family planning method.

#### **Unmet need**

Unmet need refers to unmet need for limiting and spacing.

#### **Correct knowledge of HIV/AIDS**

The women who heard about HIV/AIDS and have correct knowledge about transmission of HIV/AIDS and knowledge of prevention from HIV/AIDS.

<b>District Indicators, Jamui, (2001 Census)</b>
--

Indicators	Census 2001
Population (in thousands)	1397
Decadal Growth Rate (1991-01)	32.9
Sex Ratio*	917
Percent Urban population	7.4
Percent SC population	17.4
Percent ST population	4.8
Female Literacy Rate (7 years and above)	26.9
Male Literacy Rate (7 years and above)	57.1

## Indicators

## Number

## Indicators

## Number

## Primary Health Centre (PHC) (Contd...)

## Human Resource :

PHC having Lady Medical Officer (LMO)

4

PHC having Laboratory Technician

0

PHC organized any training programme in their PHC during last year

6

PHC having at least one MO, who received Integrated Skill Development Training for 12 days during last five years

5

PHC having at least one MO, who received IMNCI training during last five years

2

## Supply :

PHC that received the untied fund in previous financial year

4

## Sub Centre (SC) N = 27

## Infrastructure :

Sub Centre located in government building

10

Sub Centre having communication facility

0

Sub Centre having separate labour room

1

ANM staying in Sub Centre village

3

Sub Centre having staff quarter for ANM

2

Sub Centre having regular water supply

24

## Human Resource :

Sub Centre where Male Health Worker in position

1

ANM had Integrated Skill Development Training in last 5 years

5

ANM ever been trained in Integrated Skill Development Training

15

ANM trained in integrated management of neonatal and childhood illnesses (IMNCI) in last 5 years

4

ANM ever been trained in integrated management of neonatal and childhood illnesses (IMNCI)

6

ANM who attended Skilled birth attendant (SBA) training

6

## Performance :

Number of Infants and children immunized

3,176

## Supply :

Sub-Centre having auto-disposable syringes

25

Sub-Centre reporting IFA tablets out of stock for more than 10 days during last one month

23

Sub-Centre reporting Vitamin A out of stock for more than 10 days during last one month

15

Sub-Centre reporting ORS packets out of stock for more than 10 days during last one month

26

Sub-Centre that received untied fund in previous financial year

23

## Performance at a Glance
